- Postman screenshot – paste below

Describe the API you selected and what it does

- The API I selected is the Coinbase Prices API. It allows me to use a GET request to request the current spot price of a cryptocurrency and return the result in JSON format.

Cite the website that offers the API:

- Coinbase Prices API. The API can be found here  
<https://docs.cdp.coinbase.com/coinbase-business/track-apis/prices#data-api-prices>

Describe the options/parameters you used for the API request – i.e., what query info did you need to provide to the API to get your results?

- For the API request I had to provide the currency pair as the required parameter. For this assignment I hard-coded USD as the currency to compare the cryptocurrency price against.

Identify two applications where this API would be helpful.

- This API could be helpful for cryptocurrency trading apps and portfolio tracking apps. Using this API shows users the current price of cryptocurrencies for trading and can update the current value of a cryptocurrencies to accurately reflect a portfolio's value.
